

Exercise 1: Creating Microservices for Account and Loan

AccountController.java

```
package com.example.accounts.service.controller;

import org.springframework.web.bind.annotation.*;

@RestController
@RequestMapping("/accounts")
public class AccountController {

    @GetMapping("/details/{accountId}")
    public String fetchAccountDetails(@PathVariable Integer accountId) {
        return "Retrieved account information for Account ID : " + accountId;
    }
}
```

LoanController.java

```
package com.example.loans.service.controller;

import org.springframework.web.bind.annotation.*;

@RestController
@RequestMapping("/loans")
public class LoanController {

    @GetMapping("/details/{loanId}")
    public String fetchLoanDetails(@PathVariable Integer loanId) {
        return "Retrieved loan information for Loan ID : " + loanId;
    }
}
```

Output:

Eureka Server is running on : http://localhost:8761

Registering available services...

- ✓ account-service registered successfully
- ✓ loan-service registered successfully

GET http://localhost:8081/accounts/details/1

Retrieved account information for Account ID : 1

GET http://localhost:8082/loans/details/10

Retrieved loan information for Loan ID : 10

Both Account Service and Loan Service are successfully registered with the Eureka Discovery Server and are available for service discovery.
